Thank you for joining our live webinar today.
We will begin shortly. Please standby.

Principles and Practice in Seismic Design

February 24, 2022

AISC Live Webinars

Today's live webinar will begin shortly. Please stand by.

Today's audio will be broadcast through the internet. Please be sure to turn up the volume on your speakers.

Please type any questions or comments in the Q&A window.

AISC Live Webinars

AIA Credit

AISC is a Registered Provider with The American Institute of Architects Continuing Education Systems (AIA/CES). Credit(s) earned on completion of this program will be reported to AIA/CES for AIA members. Certificates of Completion for both AIA members and non-AIA members are available upon request.

This program has been submitted with AIA/CES for continuing professional education. As such, it does not include content that may be deemed or construed to be an approval or endorsement by the AIA of any material of construction or any method or manner of handling, using, distributing, or dealing in any material or product.

Questions related to specific materials, methods, and services will be addressed at the conclusion of this presentation.

Course Description – Submitted for AIA CE Credit

Principles and Practice in Seismic Design
February 24, 2022

This webinar will provide an essential review of seismic design of structural steel buildings, from the development and codification of the basic concepts to their implementation in practice. This presentation will cover important provisions of ASCE 7 and AISC 341, the fundamentals of capacity design, and the ductile behavior of various seismic force-resisting systems. Several real structures will be presented to demonstrate the concepts. Finally, the concept of performance-based seismic design will be discussed.

AISC Live Webinars

Learning Objectives – Submitted for AIA CE Credit

- Explain the scope for ASCE 7 and AISC 341 related to seismic analysis and design.
- Describe fuse mechanisms in various types of high ductility structural steel seismic force-resisting systems.
- List the considerations that factor into the decision of which type of seismic force-resisting system to use on a building project.
- Identify what types of buildings are good candidates for using a performance-based seismic design approach.

Principles and Practice in Seismic Design

Michael Engelhardt, PE, PhD
Professor, Civil Engineering
University of Texas at Austin

John Hooper, SE, PE
Senior Principal and Director of Earthquake Engineering
Magnusson Klemencic Associates

Principles and Practice in Seismic Design

1. Principles of Seismic Design in AISC 341 (Engelhardt)
2. Practical Applications of AISC 341 (Hooper)

1. Principles of Seismic Design in AISC 341

- Building Code Philosophy for Earthquake-Resistant Design and Importance of Ductility
- Design Earthquake Forces: ASCE-7
- AISC Seismic Provisions: AISC 341

9

Building Code Philosophy for Earthquake-Resistant Design and Importance of Ductility

Objective: Prevent collapse in the extreme earthquake likely to occur at a building site.

Objectives are not to:

- limit damage
- maintain function
- provide for easy repair

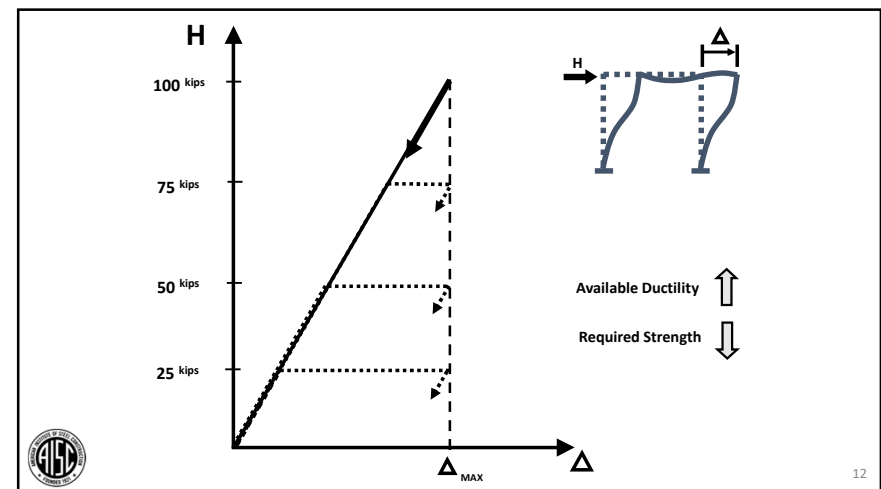

10

To Survive Strong Earthquake without Collapse: Design for Ductile Behavior

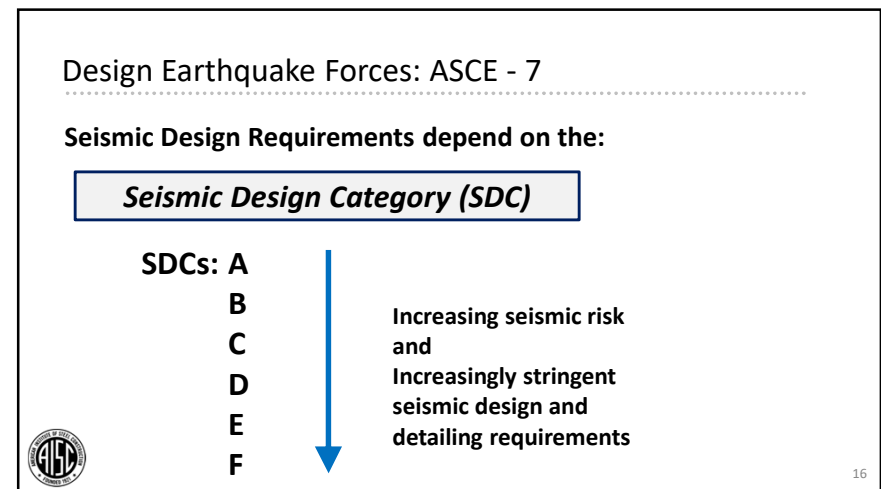

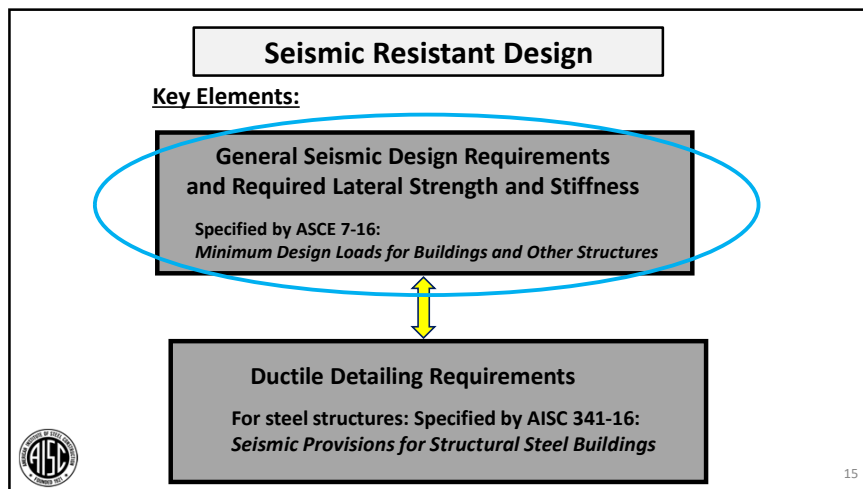

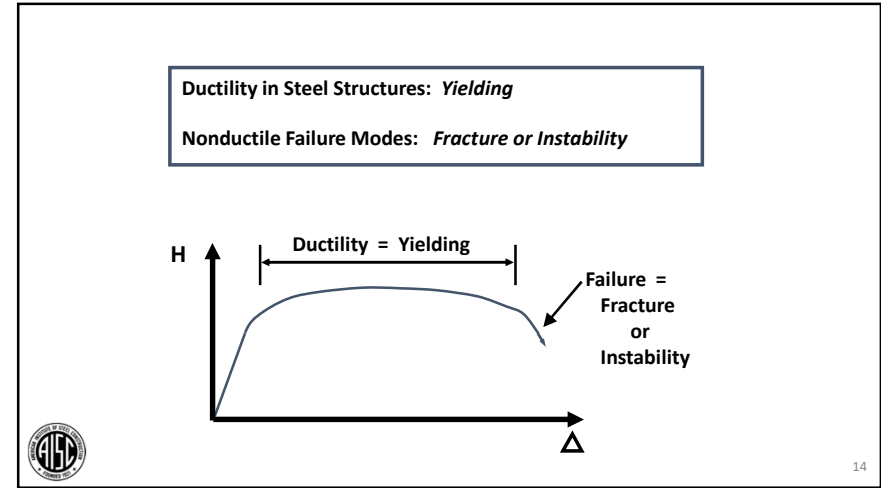

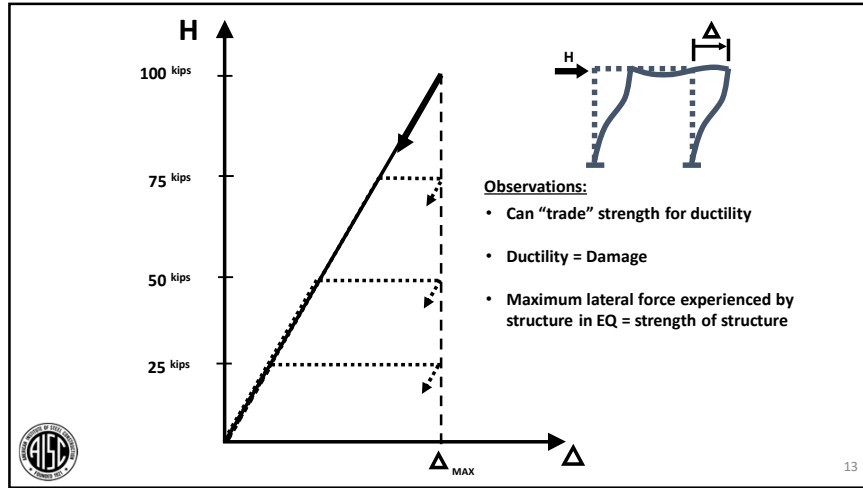

11

12

Seismic Design Category (SDC)

Depends on:

- Geographic Location
- Soil Conditions
- Importance of Structure

17

Seismic Design Requirements depend on the:

Seismic Design Category (SDC)

- SDCs: A — Minimal seismic design requirements
- B } Relatively simple approaches possible
- C }
- D } "High level" seismic design required
- E }
- F }

18

Analysis Options per ASCE 7-16

- Equivalent Lateral Force Method
- Modal Response Spectrum Analysis
- Seismic Response History Analysis
 - Linear
 - Nonlinear

19

Equivalent Lateral Force Method

$$V = C_s W$$

V = total design lateral force or shear at base of structure

W = effective seismic weight of building

C_s = seismic response coefficient

20

$V = C_s W$

$$C_s = \frac{S_{Ds}}{\left(\frac{R}{I_e}\right)} \leq \begin{cases} \frac{S_{D1}}{T \left(\frac{R}{I_e}\right)} & \text{for } T \leq T_L \\ \frac{S_{D1} T_L}{T^2 \left(\frac{R}{I_e}\right)} & \text{for } T > T_L \end{cases}$$

S_{Ds} = design spectral acceleration at short periods
 S_{D1} = design spectral acceleration at 1-second period
 I_e = importance factor
 T = fundamental period of building
 T_L = long period transition period
 R = response modification coefficient

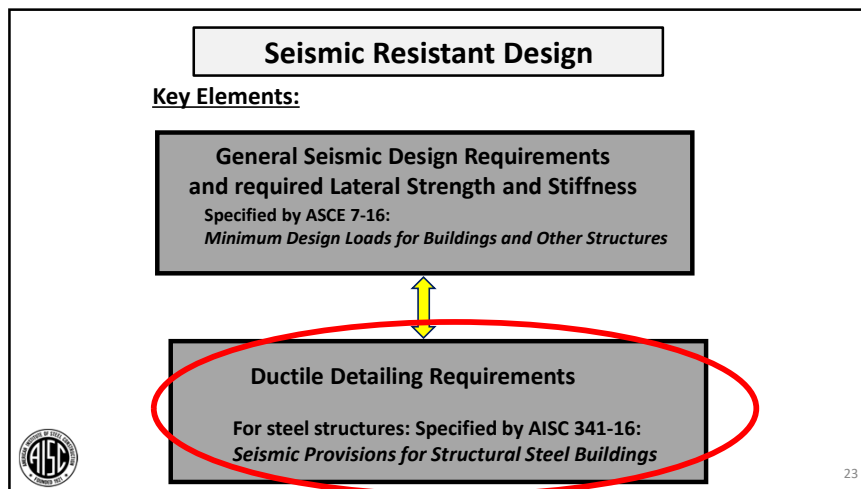

21

R factors for Selected Steel Systems (ASCE 7-16):

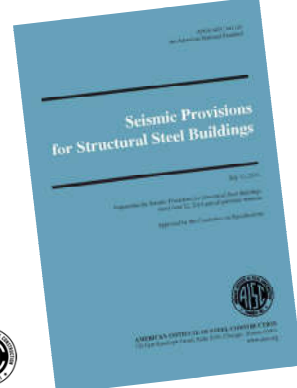

SMF (<i>Special Moment Resisting Frames</i>):	R = 8
IMF (<i>Intermediate Moment Resisting Frames</i>):	R = 4.5
OMF (<i>Ordinary Moment Resisting Frames</i>):	R = 3.5
EBF (<i>Eccentrically Braced Frames</i>):	R = 8
SCBF (<i>Special Concentrically Braced Frames</i>):	R = 6
OCBF (<i>Ordinary Concentrically Braced Frames</i>):	R = 3.25
BRBF (<i>Buckling Restrained Braced Frame</i>):	R = 8
SPSW (<i>Special Plate Shear Walls</i>):	R = 7
Undetailed Steel Systems in Seismic Design Categories B or C (AISC Seismic Provisions not needed)	R = 3

22

AISC Seismic Provisions: AISC 341

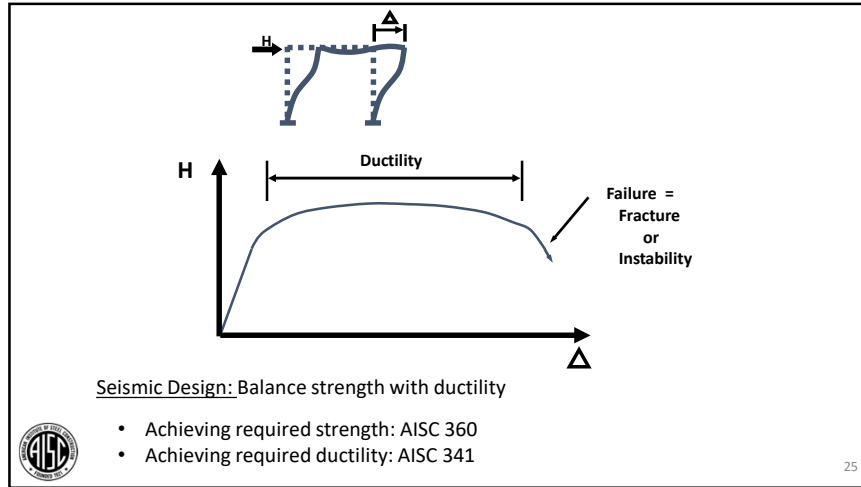

AISC 341:

- Design and detailing requirements to achieve appropriate level of ductility.
- Used together with AISC 360 (Specification for Structural Steel Buildings).
- AISC 341 focus is on “systems”
- AISC 341 used when required by the Applicable Building Code

24

25

27

- AISC 341 – Examples of Structural Steel Seismic Force Resisting Systems**
- High Ductility Systems:**
- Special Moment Frames (SMF): R = 8
 - Eccentrically Braced Frames (EBF): R = 8
 - Buckling Restrained Braced Frames (BRBF): R = 8
 - Special Plate Shear Walls (SPSW): R = 7
 - Special Truss Moment Frames (STMF): R = 7
 - Special Concentrically Braced Frames (SCBF): R = 6
- Intermediate Ductility Systems:**
- Intermediate Moment Frames (IMF): R = 4.5
- Nominal Ductility Systems:**
- Ordinary Moment Frames (OMF): R = 3.5
 - Ordinary Concentrically Braced Frames (OCBF): R = 3.25

28

Guiding Principle for High Ductility Systems: *Capacity Design*

1. Choose frame elements ("fuses") that will yield in an earthquake; e.g. beams in moment resisting frames, braces in concentrically or buckling restrained braced frames, links in eccentrically braced frames, etc.
2. Detail "fuses" to sustain large inelastic deformations prior to the onset of fracture or instability (i.e. detail fuses for ductility).
3. Design all other frame elements to be stronger than the fuses, i.e. design all other frame elements to develop the plastic *capacity* of the fuses.

29

Additional Concepts for Developing Ductility

- Avoid high strength steels in ductile elements.
- Use cross-sections with low b/t ratios (delay local buckling).
- Provide adequate lateral bracing (delay lateral torsional buckling).
- Connections generally stronger than members.
- Conservative column design.
- Take care in welding and welding quality control.

30

Overview of Selected High Ductility Systems

- Special Moment Frames (SMF)
- Special Concentrically Braced Frames (SCBF)
- Eccentrically Braced Frames (EBF)
- Buckling Restrained Braced Frames (BRBF)

31

Special Moment Frames (SMF)

Beams and columns with moment resisting connections; resist lateral forces by flexure and shear in beams and columns - i.e. by frame action.

Develop ductility primarily by flexural yielding of the beams.

Developing Ductile Behavior in SMF – General Approach

- Design frame so that inelastic behavior is restricted primarily to flexural yielding in the beams, with limited yielding permitted in column panel zones..
- Choose beam section that satisfy highly ductile b/t limits.
- Provide beam lateral bracing that satisfies highly ductile requirements.

- Design beam-column connections to develop strength of beams.
- Choose columns with flexural capacity greater than beams (so plastic hinges form in beams); and choose columns to resist axial forces developed by fully yielded beams.

The diagram shows a frame similar to the one in slide 34, but with a grey background and yellow dashed lines indicating the intended location of plastic hinges at the beam ends.

Developing Ductile Behavior in SMF – Additional Details

Beams and Columns:
Satisfy b/t limits for *highly ductile* members

Provide lateral bracing that satisfies requirements *highly ductile* members

The diagram shows a frame with red 'X' marks at the ends of all beams and columns, indicating the locations where lateral bracing should be provided. The AISC logo is in the bottom left corner.

41

42

43

44

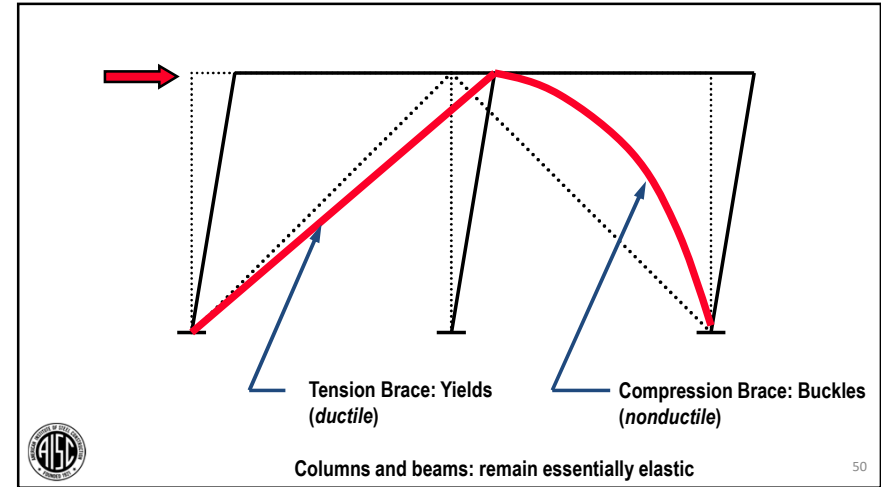

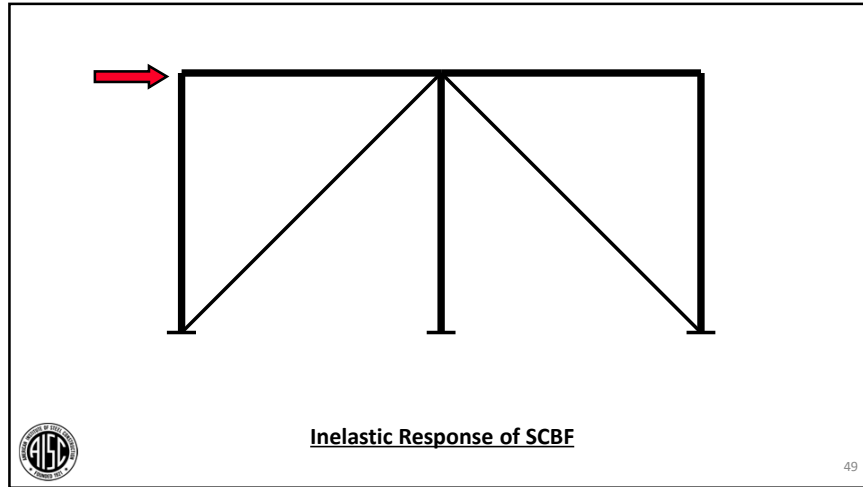

Special Concentrically Braced Frames (SCBF)

Beams, columns and braces arranged to form a vertical **truss**. Resist lateral earthquake forces by truss action.

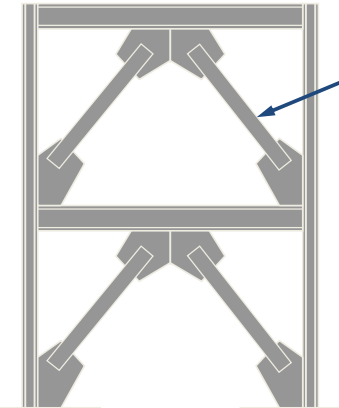

Develop ductility through inelastic action in **braces**.

- braces yield in tension
- braces buckle in compression

48

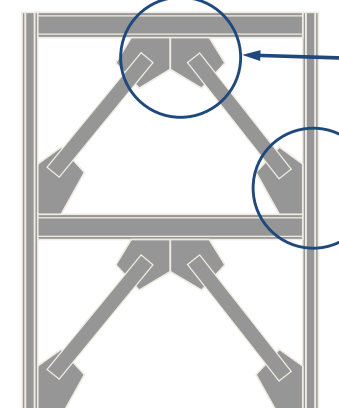

Developing Ductile Behavior in SCBF

- Design frame so that inelastic behavior is restricted to braces.
 - Braces are "fuse" elements of frame.
 - Braces are weakest element of frame.
- Balance tension and compression braces (so reasonable number of braces are in tension for each direction of loading).
- Choose brace members with good energy dissipation capacity and fracture life (limit kL/r and b/t).

53

- Design brace connections for maximum forces and deformations imposed by brace during cyclic yielding/buckling

55

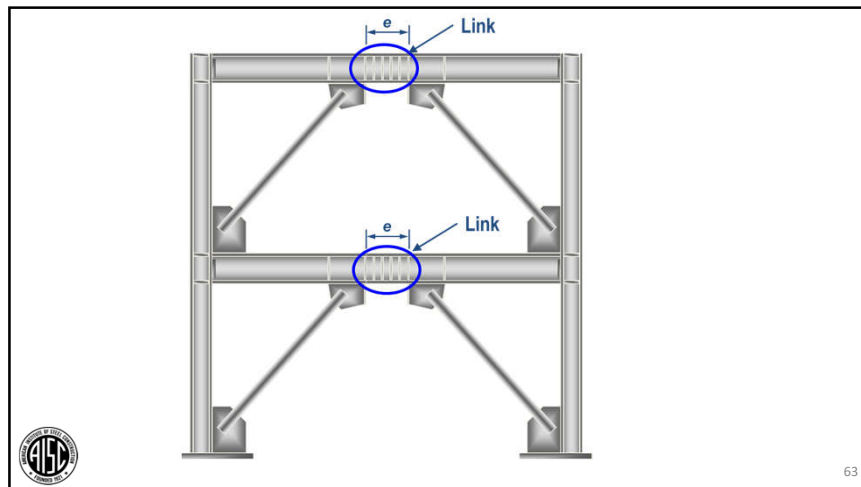

Eccentrically Braced Frames (EBF)

Framing system with beam, columns and braces. At least one end of every brace is connected to isolate a segment of the beam called a *link*.

Develop ductility through inelastic action in the *links*.

62

Developing Ductile Behavior in EBF

A 2D perspective diagram of a steel moment-resisting frame (EBF) with links highlighted in red. Blue arrows point from the text box to the links. The frame consists of two columns, two beams, and two diagonal bracing members. The AISC logo is in the bottom left corner, and the number 67 is in the bottom right corner.

- Design frame so that inelastic behavior is restricted to links.
 - Links are "fuse" elements of frame.
 - Links are weakest element of frame.
- Detail links to provide high ductility (stiffeners, lateral bracing).

Buckling Restrained Braced Frames (BRBF)

Type of concentrically braced frame.

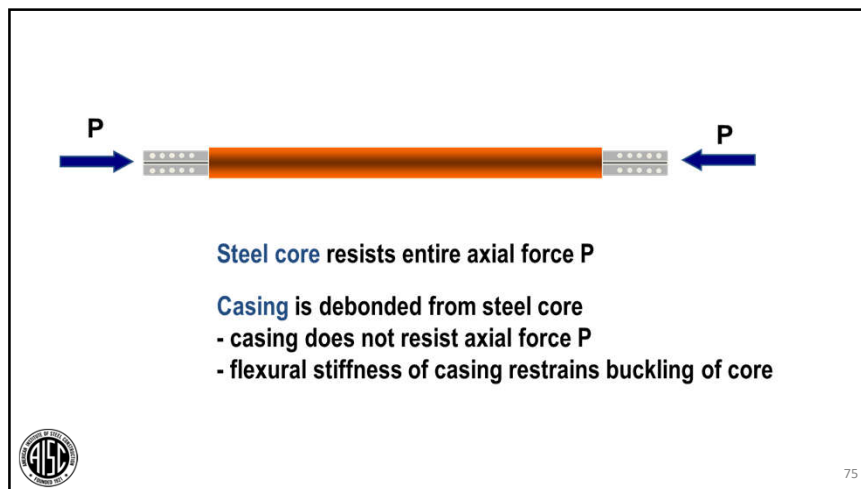

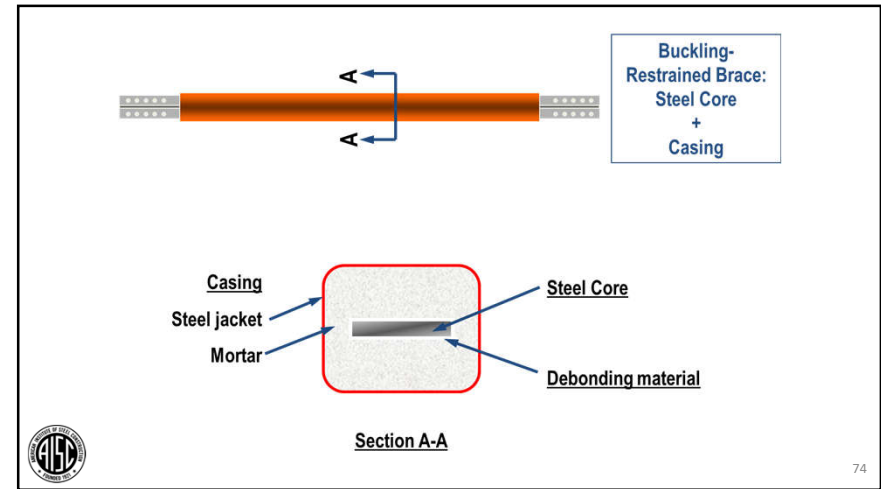

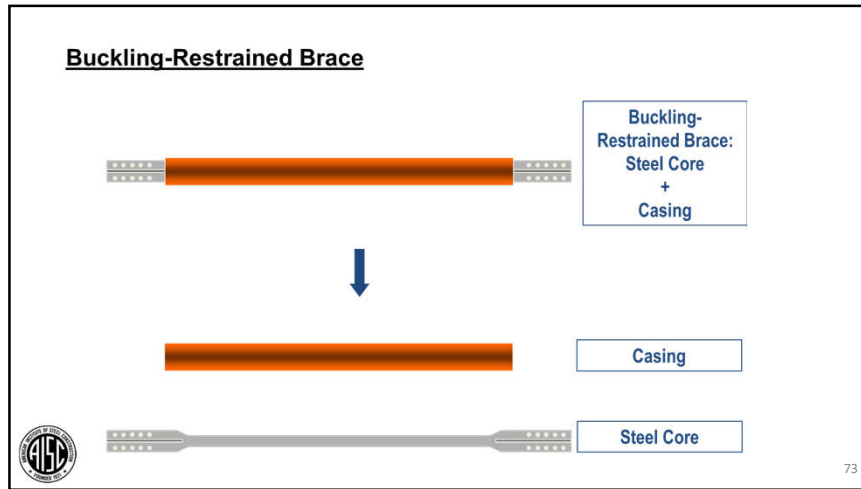

Beams, columns and braces arranged to form a vertical **truss**. Resist lateral earthquake forces by truss action.

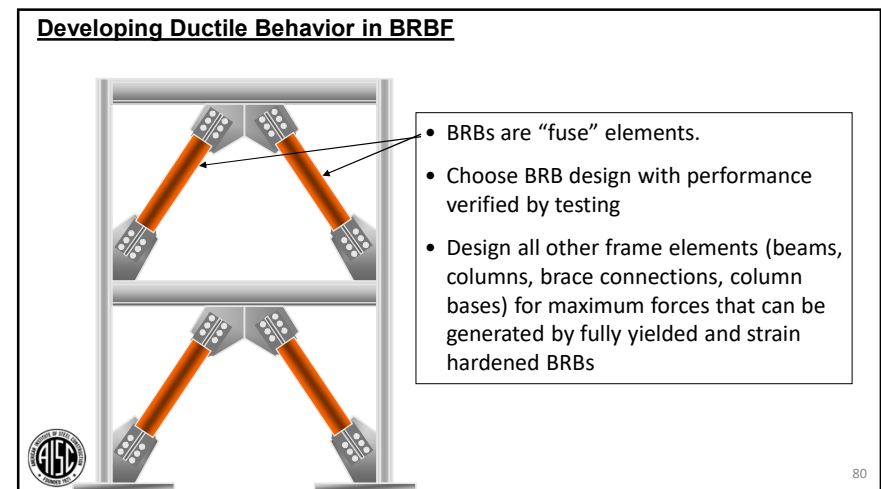

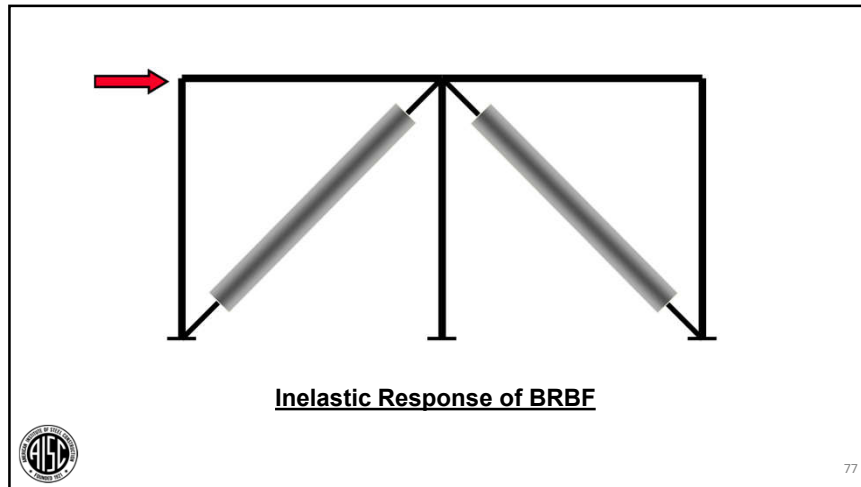

Special type of brace members used: **Buckling-Restrained Braces (BRBs)**. BRBs yield both in tension and compression - **no buckling !!**

Develop ductility through inelastic action (cyclic tension and compression yielding) in BRBs.

Performance-Based Seismic Design (NLRHA)

- High Seismic Hazard Locations (SDC D or E)
 - New Systems
 - Buildings With Structural Height > 240'
 - Exceeds System Height Limit
 - Buildings With Structural Height > ~160'
 - Column Axial Demands Become “Excessive”
 - Capacity-limit Design Requirements
 - Intersecting Frame Effects Requirements

126

Performance-Based Seismic Design (NLRHA)

Section D1.4a

For columns that are common to intersecting frames, determination of the required axial strength, including the overstrength seismic load or the capacity-limited seismic load, as applicable, shall consider the potential for simultaneous inelasticity from all such frames. The direction of application of the load in each such frame shall be selected to produce the most severe load effect on the column.

127

Performance-Based Seismic Design (NLRHA)

Section D1.4a

Exceptions:

- It is permitted to limit the required axial strength for such columns based on a three-dimensional nonlinear analysis in which ground motion is simultaneously applied in two orthogonal directions, in accordance with Section C3.
- Columns common to intersecting frames that are part of Sections E1, F1, G1, H1, H4 or combinations thereof need not be designed for these loads.

128

Performance-Based Seismic Design (NLRHA)

C3. Nonlinear Analysis

When nonlinear analysis is used to satisfy the requirements of these Provisions, it shall be performed in accordance with the applicable building code.

User Note: ASCE/SEI 7 permits nonlinear analysis by a response history procedure. Material and geometric nonlinearities are to be included in the analytical model. The main purpose is to determine expected member inelastic deformations and story drifts under representative ground motions. The analysis results also provide values of maximum expected internal forces at locations such as column splices, which can be used as upper limits on required strength for design.

129

Performance-Based Seismic Design (NLRHA)

C3. Nonlinear Analysis

When nonlinear analysis is used to satisfy the requirements of these Provisions, it shall be performed in accordance with the applicable building code.

User Note: ASCE/SEI 7 permits nonlinear analysis by a response history procedure. Material and geometric nonlinearities are to be included in the analytical model. The main purpose is to determine expected member inelastic deformations and story drifts under representative ground motions. **The analysis results also provide values of maximum expected internal forces at locations such as column splices, which can be used as upper limits on required strength for design.**

142

Summary

- Seismic Design Category → Lateral Force-Resisting System
 - But Not Always
 - Overall Building Cost is Primary Driver
- Use of PBS (NLRHA) is Becoming More Commonplace in High Seismic Hazard Regions
 - Buildings with Structural Height > 160'

143

AISC | Questions?

144

CEU / PDH Certificates

For those participating at their own connection...

- Reporting attendance is not necessary.
- Certificates will be issued based on AISC's attendance record.
- You will be receiving certificates via email from registration@aisc.org.

CEU / PDH Certificates

For those participating at one connection with a group...

- Main registrant will report attendance via an online form. (The link will be provided in an email from registration@aisc.org.)
 - Username: Same as AISC website username.
 - Password: Same as AISC website password.
- Once attendance has been reported, each group member will be receiving certificates via email from registration@aisc.org.

AISC | Thank you
